

Secure Enterprise File Sharing and Mobile Content Management

Organizations need to share files. In fact, over 50% of business processes, including some of the most critical, are document-based. However, most file sharing solutions have consumer-grade roots, and were not built with the security that enterprises need, balanced with the collaboration and mobility features their end users want. BlackBerry Workspaces™ makes enterprises more mobile and collaborative, while reducing the risk, complexity and cost of sharing information across and beyond your organization. Workspaces embeds digital rights management (DRM) protection in your files, so your content remains secure everywhere it goes. With Workspaces, you stay in control – even after files are shared outside your firewall.

Workspaces helps make your employees more mobile and collaborative, while reducing the risk, complexity and cost of sharing information within and beyond your organization.

When data matters, organizations with the highest security requirements trust BlackBerry Workspaces. Only Workspaces delivers the features users want and the control IT needs.

Secure, Mobilize and Share Files

The Functionality Users Want

Intuitive Experience: Deliver consumer-like usability that displays perfectly on every device.

Mobility: Work from anywhere with files always in sync. Access, synchronize, share and control files on all platforms: web, mobile (iOS, Android™, BlackBerry® 10), and desktop (Windows®, Mac®).

Productivity: Access, create, annotate (highlight, comment, draw, erase), edit (Apps and Editor), search (folders, files and content), stream and share files through integrated mobile applications.

Internal and External Collaboration: Share files with anyone (internal and external), anywhere, on any device, without losing visibility or control.

Large File Transfer: Share extremely large files with colleagues, partners and third parties easily.

File Locking: Prevent duplication of effort by temporally limiting access to a document while it's being edited.

Secure, Mobilize and Share Files

The Functionality IT Needs

Data Protection: Keep sensitive data encrypted and controlled by default, reducing the risk of a breach or loss of intellectual property.

Easy-to-Use DRM Controls: Manage, view, create, search, edit, print, download, forward and annotate Microsoft Office, PDF and image files. Apply custom, administrative watermarks or use the spotlight feature to deter screenshots and increase accountability. Track, revoke, wipe or expire file access at any time - even after the document has been downloaded or shared.

Security: Implement enterprise-level security, including mobile passcode, jailbreak detection, remote document control, full tracking, always-on AES-256 encryption (in transit, at rest, and in use) and advanced key management (optional HSM).

Visibility: Gain visibility into how users are accessing sensitive data and what they do with it, maintaining an audit trail.

Flexible Deployment Options: Choose to deploy BlackBerry Workspaces in the cloud, on-premises or as a hybrid solution.

Integration: Workspaces provides connectors for Microsoft content repositories (SharePoint, SharePoint Online, OneDrive for Business) and Windows File Shares (CIFS).

This allows users to securely share documents that reside internally within file shares directly with customers. They can collaborate with external partners on files that reside within SharePoint Online while retaining control of corporate IP. You can also take advantage of simplified management via BlackBerry UEM integration for on-premises Workspaces deployments.

Usability Enhancements

- Ability to mark files as Favorites
- Quick access filters: Recent locations, Favorites
- Multiple selection of files and folders
- Collaboration mode on received and sent files – allows users to track activities on files shared with others, update sent and received files, and access previous versions from their mobile device.
- Ability to create new workspaces on external repositories (SharePoint, SharePoint Online, One Drive, CMIS-compliant repositories, FileShare, CIFS)

Email Protector

BlackBerry Workspaces Email Protector is a standalone solution that automatically applies file-level encryption, user access and DRM controls to outbound email attachments, based on controllable policies such as recipient or file type. This means that system administrators can ensure that all files leaving the corporate firewall are protected by Workspaces file security. Email Protector can be purchased and deployed separately from, or alongside, Workspaces EFSS.

Workspaces in the Enterprise

Virtually every business has sensitive information and documents that need to be shared. Hundreds of global companies in nearly every industry have deployed Workspaces for a wide variety of use cases:

- Replace unsecure consumer-grade file sharing systems with a secure alternative
- Enable executives and board members to securely view, edit and annotate highly sensitive documents on their personal iPads and other endpoints
- Exchange files through data rooms for M&A and other business transactions
- Integrate with SharePoint, Windows file shares (CIFS) and SharePoint Online to leverage existing investments and get a single view of all content
- Distribute non-public financial reports to investors
- Protect intellectual property, such as blueprints, product specs, formulas, scripts and screenplays
- Extend compliance reach to mobile devices and external collaborations – for SOX, PCI, HIPAA, FINRA, GLBA, 21 CFR Part 11, ITAR, POPI and other information security regulations
- Ensure all data, including emails and attachments, stay discoverable for eDiscovery, no matter where files travel

Enabling Technology Transformation, Securely

BlackBerry Workspaces was built to secure information in the collaborative and mobile world of modern IT. It is designed to provide the granular, flexible and powerful security required by IT, while still delivering an elegant and intuitive user experience across web browsers, desktops, mobile devices and tablets.

Where endpoints, networks and technology infrastructure fall short in providing persistent protection, Workspaces uniquely controls and tracks all sensitive corporate assets wherever they go in the course of business.

About Workspaces

BlackBerry Workspaces secures your enterprise content wherever it travels. With Workspaces, all stakeholders can safely access, share and collaborate on even the most sensitive files, using any mobile (iOS, Android, BlackBerry) or desktop (Windows, Mac) device.

Combining an easy, intuitive user experience with a unique data-centric architecture (which embeds protection right in your files), BlackBerry Workspaces is designed to meet the needs of your organization, IT team and users.

BlackBerry Workspaces also provides the flexibility to deploy as you want: cloud, on premises or a hybrid. For more information, visit www.blackberry.com/workspaces.
