

Avoid Patch Doomsday

THE PATCH MANAGEMENT IMPERATIVE

Whether it's system outages or security breaches, IT problems of any kind affect business success. To avoid Patch Doomsday, organizations should implement a patch management process with powerful, automated tools.

EFFICIENTLY MANAGE YOUR VULNERABILITIES

New patches must be applied consistently to keep operating systems and applications current. Verismic's Cloud Management Suite (CMS) identifies the most critical missing updates in your environment for strategic, targeted deployment. Maintenance plans can also schedule updates at your leisure.

AN AGENTLESS SOLUTION

Cloud Management Suite uses agentless technology to keep devices up to date with the latest patches. Loading on demand and dissolving when complete, there is never anything to install or configure. Additionally, all patching activity is recorded for full security auditing purposes.

CHOOSING THE BEST TOOLSET

Manual patch processes are inefficient, resource intensive, and error-prone. Thus, it is crucial to select a patching solution like Cloud Management Suite to overcome the challenges in building a patch management process.
